〈TRIGGER ELEMENT〉

BS08D

TRIGGER APPLICATION
LEAD MOUNT TYPE

DESCRIPTION

BS08D is a silicon planer transistor, bilateral switching integrated circuit. It is suitable for trigger application of thyristor.

FEATURE

- Low switching voltage Vs=7～9V
- Good switching voltage temperature coefficient 0.01%/℃
- With gate electrode. It is easy for control and synchronism of switching.

APPLICATION

Trigger circuit of thyristor・triac oscillator, timer.

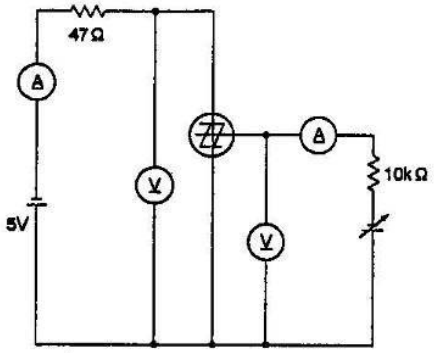
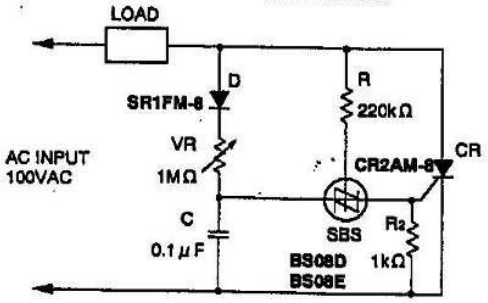
GATE TRIGGER CHARACTERISTIC TEST CIRCUIT



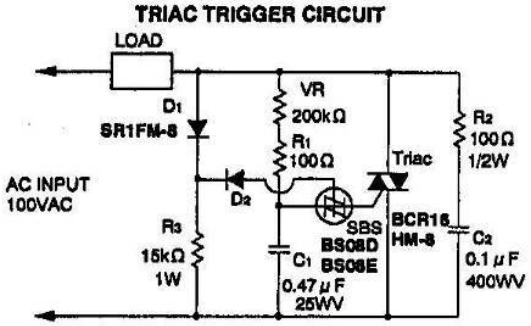
APPLICATION EXAMPLE

THYRISTOR TRIGGER CIRCUIT



The above circuit is a thyristor phase control circuit making use of an [illegible]. In this circuit, using the SBS gate, the residual charge on C is reset, reducing the hysteresis characteristics. Therefore, over the range of the variable resistor, phase control (in the range 5 to 175°C) is possible, making this circuit widely useful in DC motor control and other control applications.

TRIAC TRIGGER CIRCUIT



The above circuit is a triac phase control circuit making use of an SBS. In this circuit, an SBS gate is used to reduce the hysteresis characteristics. Thus, by using the variable resistance, phase control is possible over the wide range of 10 to 160 °C. Therefore, this circuit is widely usable in such applications as lighting control circuits, electric heater control, and other load control applications.

Keep safety first in your circuit designs!

·ISAHAYA Electronics Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (1) placement of substitutive, auxiliary, (2) use of non-farmable material or (3) prevention against any malfunction or mishap.
